

# Dashboard Portal

## Deployment & Rollout Guide

How to establish the internal Power BI Dashboard Portal at HonorVet Technologies

---

|                            |                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------|
| <b>Prepared for:</b>       | HonorVet Technologies - Internal IT / Operations                                                     |
| <b>Document:</b>           | Dashboard Portal - Setup, Configuration & Deployment Steps                                           |
| <b>Categories covered:</b> | Executive, HR, Finance, Operations, Performance, Recruitment, Healthcare, IT, NON-IT, Pharmaceutical |
| <b>Technology:</b>         | HTML5, CSS3, Vanilla JavaScript - static site, no server required                                    |

# 1. What This Portal Does

---

The Dashboard Portal is a single internal web page that gives every employee one place to find and open the company's Power BI dashboards, organized by category - including the four new business-vertical categories: **Healthcare**, **IT**, **NON-IT**, and **Pharmaceutical** - alongside existing functional categories like Executive, HR, Finance, Operations, Performance, and Recruitment.

It is a fully static website (no database, no server-side code, no paid software) built from HTML, CSS, and JavaScript files. This means it can be deployed almost anywhere your company can host a web page, and it requires no ongoing software licensing cost.

**Important:** The portal itself never handles Power BI login, licensing, or security. Every dashboard link opens (or embeds) Power BI directly, so all authentication and Row-Level Security continue to be enforced by Power BI exactly as they are today.

## 2. Prerequisites Before You Start

---

- Admin/edit access to the **dashboard-portal** project folder (index.html, dashboard.html, css/, js/, assets/).
- The Power BI report links for each dashboard you want to publish, one per category (Healthcare, IT, NON-IT, Pharmaceutical, Executive, HR, Finance, Operations, Performance, Recruitment).
- Confirmation from whoever manages your Power BI tenant that each report's sharing/embed settings and Row-Level Security (RLS) are configured correctly for the intended audience.
- A hosting location: either an existing internal web server (IIS/Apache/Nginx) or a free external static host (GitHub Pages, Netlify, Cloudflare Pages).
- Your company logo file and brand colors (hex codes), if you want the portal to match your brand rather than the default placeholder styling.

## 3. Step-by-Step: Establishing the Portal in Your Organization

---

### 1 Confirm the category changes

- The Sales category has been removed.
- Four new categories have been added: **Healthcare**, **IT**, **NON-IT**, and **Pharmaceutical** - each with a placeholder dashboard card in `js/dashboards.js`.
- No other files needed to change - categories and filters are generated automatically from whatever is listed in `js/dashboards.js`.

### 2 Replace every placeholder Power BI link

- Open `js/dashboards.js` in any text editor (Notepad, VS Code, etc.).
- For each dashboard object, replace "`https://app.powerbi.com/view?r=YOUR_REPORT_ID_HERE`" with the real Power BI report URL for that vertical or department.
- Use a standard Power BI report link (opened while signed in) - **never** a "Publish to web" link for confidential HonorVet data, since Publish to web has no login and no Row-Level Security.
- Save the file. No other file needs to be touched.

### 3 Confirm Power BI access and Row-Level Security (RLS)

- For each report, verify in the Power BI service that the right HonorVet security groups or users have viewer access (e.g. Healthcare recruiters see the Healthcare dashboard, IT team sees the IT dashboard, and so on).
- If different employees within the same category should see different data (e.g. by region or client), confirm RLS roles are configured in the underlying semantic model - the portal does not add or enforce this itself.

### 4 Apply HonorVet branding

- Replace `assets/images/logo-placeholder.svg` with the HonorVet Technologies logo.
- Open `css/style.css` and update the color variables at the top of the file (`--color-primary`, `--color-accent`, etc.) to match HonorVet's brand colors.
- Update the portal title/subtitle text ("Dashboard Portal", "Company Analytics Hub") inside the `.brand` sections of `index.html`, if desired.

### 5 Test locally before publishing

- Run a local server from the dashboard-portal folder, e.g. `python -m http.server 8080`, then open `http://localhost:8080` in a browser.
- Confirm all ten dashboard cards appear, search works, and each of the ten category filters (Executive, HR, Finance, Operations, Performance, Recruitment, Healthcare, IT, NON-IT, Pharmaceutical) shows the right dashboards.

- Open one real dashboard end-to-end and confirm it loads inside the portal, or gracefully falls back to an "Open in New Tab" message if Power BI blocks embedding.

**6****Choose a hosting location**

- **Internal web server (recommended for confidential data):** copy the dashboard-portal folder into your existing IIS, Apache, or Nginx web root. No special server configuration is required since there is no server-side code.
- **Free external static hosting:** GitHub Pages, Netlify, or Cloudflare Pages if HonorVet prefers an externally hosted URL. Power BI's own login still protects the underlying data even if the portal page itself is reachable externally - but confirm this is acceptable to IT/security policy first.
- Serve the site over **HTTPS** in production so traffic between employees' browsers, the portal, and Power BI is encrypted.

**7****Deploy**

- Upload/copy the final dashboard-portal folder to the chosen hosting location.
- Confirm the site loads at its production URL (e.g. <https://dashboards.honorvet.com> or an internal intranet address).
- Re-test search, filters, favorites, and at least one real dashboard from the production URL (not just localhost), since some browsers restrict localStorage/iframes differently across origins.

**8****Roll out to employees**

- Share the production URL with employees, e.g. via email, Teams/Slack announcement, or adding it to the company intranet homepage.
- Consider bookmarking or pinning it as a browser homepage/favorite for teams that use it daily.
- Let each vertical team (Healthcare, IT, NON-IT, Pharmaceutical, HR, Finance, Operations) know which dashboard applies to them.

**9****Establish an ongoing maintenance owner**

- Assign one person (e.g. an IT admin or BI analyst) as the owner of **js/dashboards.js**.
- To add a dashboard: copy an existing entry, give it a unique id, fill in name/description/category/url/icon, save - it appears automatically.
- To remove a dashboard: delete its object from the array and save.
- To create a brand-new category in the future: simply type a new category name in any dashboard's category field - no other configuration is needed.

**10****Final security review before go-live**

- No dashboard in js/dashboards.js still has a placeholder YOUR\_REPORT\_ID\_HERE URL.
- No confidential dashboard uses a "Publish to web" link.
- Row-Level Security is configured for any report where different employees should see different data.
- The site is served over HTTP/HTTPS from a real server, not opened as a raw file, so favorites/recents and dashboard embedding work reliably.

## 4. Quick Reference - Categories & Files

| Category       | Dashboard (placeholder)  | Notes                                            |
|----------------|--------------------------|--------------------------------------------------|
| Executive      | Executive Overview       | Company-wide KPIs for leadership                 |
| Recruitment    | Recruitment Dashboard    | Hiring pipeline analytics                        |
| HR             | HR Dashboard             | Workforce and attrition analytics                |
| Finance        | Finance Dashboard        | Budget vs. actuals, cash flow                    |
| Healthcare     | Healthcare Dashboard     | New - Healthcare vertical recruiting metrics     |
| IT             | IT Dashboard             | New - IT vertical recruiting metrics             |
| NON-IT         | NON-IT Dashboard         | New - Non-IT vertical recruiting metrics         |
| Pharmaceutical | Pharmaceutical Dashboard | New - Pharmaceutical vertical recruiting metrics |
| Operations     | Operations Dashboard     | Service delivery, ticket volume                  |
| Performance    | Employee Performance     | Goals and review cycles                          |

### Where to make changes

- **js/dashboards.js** - add, remove, or edit dashboards and categories (the only file you'll touch day-to-day).
- **css/style.css** - brand colors, fonts, spacing (top of file, :root block).
- **assets/images/logo-placeholder.svg** - company logo file.
- **README.md** (in the project folder) - full written reference for every task above.

For the complete technical reference - including the difference between Power BI "Publish to web", secure embedding, and direct report links, plus a full pre-production checklist - see **README.md** included in the dashboard-portal project folder.
